

Trimble WorksManager

Software

Stay connected, stay on track

Trimble® WorksManager Software allows users to automatically transfer data to and from the field without ever leaving the office. Increase efficiency and save on drive time by wirelessly transferring data such as 3D designs to the construction site. Supervisors and data managers will be sure that the right machines or data collectors are always using the current design. A practical dashboard shows managers an overview of their sites. Contractors can prevent costly mistakes and rework by seeing their construction technology in the field in real time.

Intuitive software, seamless transfer

WorksManager is the mobile friendly data hub connecting civil contractors to the critical information they need to get the job done right the first time, minimizing delays and downtime.

Track and assist your assets remotely

Keep projects on track and prevent miscommunications with detailed real-time information about the device's location, firmware version, current projects and design version.

WorksManager allows you to share device data from various accounts into a single project for more efficient project management and device monitoring. Access device information and design files in one centralized location, keeping track of the devices you own and those that are shared with you.

To decrease drive time, the remote assistant lets you troubleshoot issues in the field, from the office. Respond faster when things go wrong and get everyone back to work, ensuring projects stay on track.

Easily manage data and technology assets across project sites

Wirelessly transfer data between the office and the field

Send corrections from base to rovers through the Internet Base Station Service (IBSS)

Provide remote assistance

Archive projects and data, storing them safely in the cloud

Manage projects from the office by seeing machines location and the designs they are running

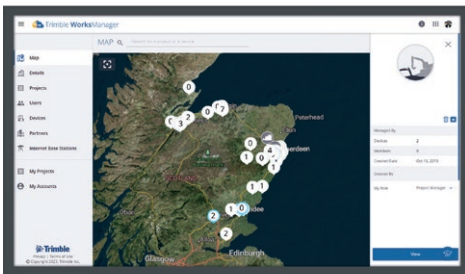

Trimble WorksManager

Software

Intuitive dashboard shows your digital assets and design information

Ensure all your projects are on track with an account level map

Effectively manage data on field devices - updating and archiving designs and projects

Up-to-date and accurate data

Machine locations update every 30 seconds and machine status update every 5 minutes to ensure you have the latest information — make decisions quickly to stay under budget and minimize rework.

Automatically send designs to machines when they arrive on site and easily archive obsolete versions when new designs are published. Always use the latest designs while freeing up space on field devices and safely storing data in the cloud.

Manage devices and users

Easily archive entire projects, removing data from all devices in a single click. Receive notifications regarding firmware updates and warranty expirations, simplifying the process of keeping your devices up to date. Define user roles to control project accessibility, limiting who can edit, make changes, or simply view information.

Extend your range

With Internet Base Station Service (IBSS) you can extend the range of your existing base station corrections so you can work with confidence over a larger area.

User-friendly Trimble integration

WorksManager is optimized for the latest Trimble technology and integrates with the Trimble Earthworks Grade Control Platform, Trimble Siteworks Positioning System, Trimble Groundworks Machine Control System, Trimble WorksOS Software and Trimble Business Center.
